

LORENTZ TRANSFORMATION

LORENTZ TRANSFORMATION

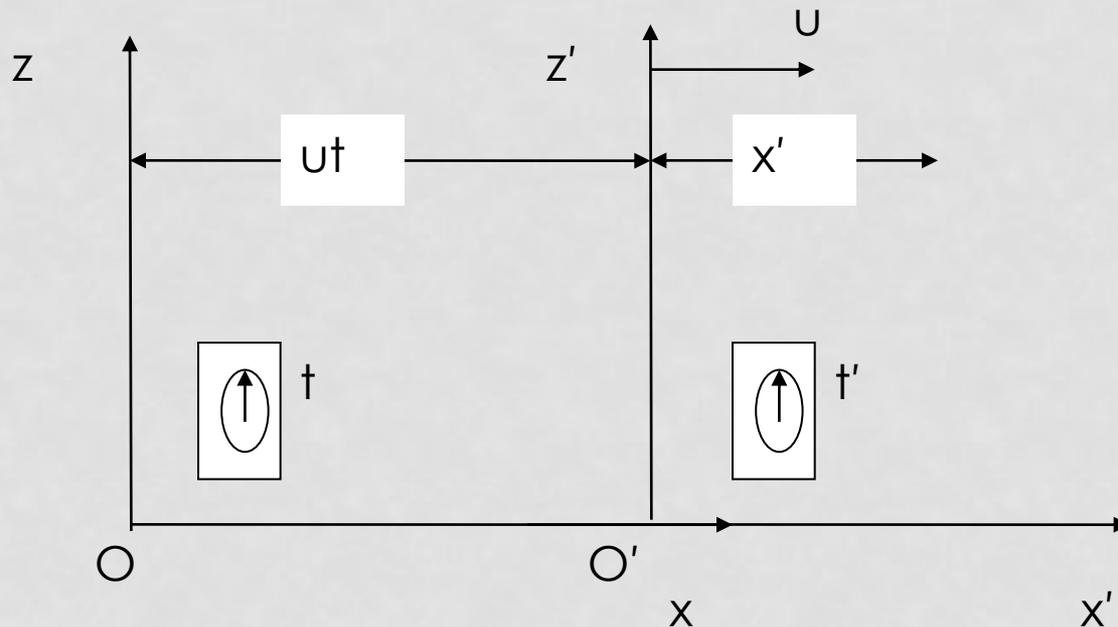

- Again consider the transformation problem.
- The required transformation consists of equations allowing us to calculate the primed set of numbers in terms of the unprimed set or vice versa.
- The Lorentz transforms replace the Galilean transforms of position and time.

$$(x', y', z'; t')$$

$$(x, y, z; t)$$

LORENTZ TRANSFORMATION

- The Lorentz transformations will be proved at a later.
- Again consider the case,

LORENTZ TRANSFORMATION

- The Lorentz transformations for position and time are:

$$x = (x' + vt')\gamma$$

$$t = \gamma \left(t' + \frac{vx'}{c^2} \right)$$

$$y = y' \quad z = z'$$

LORENTZ TRANSFORMATION

- The inverse of these equations give:

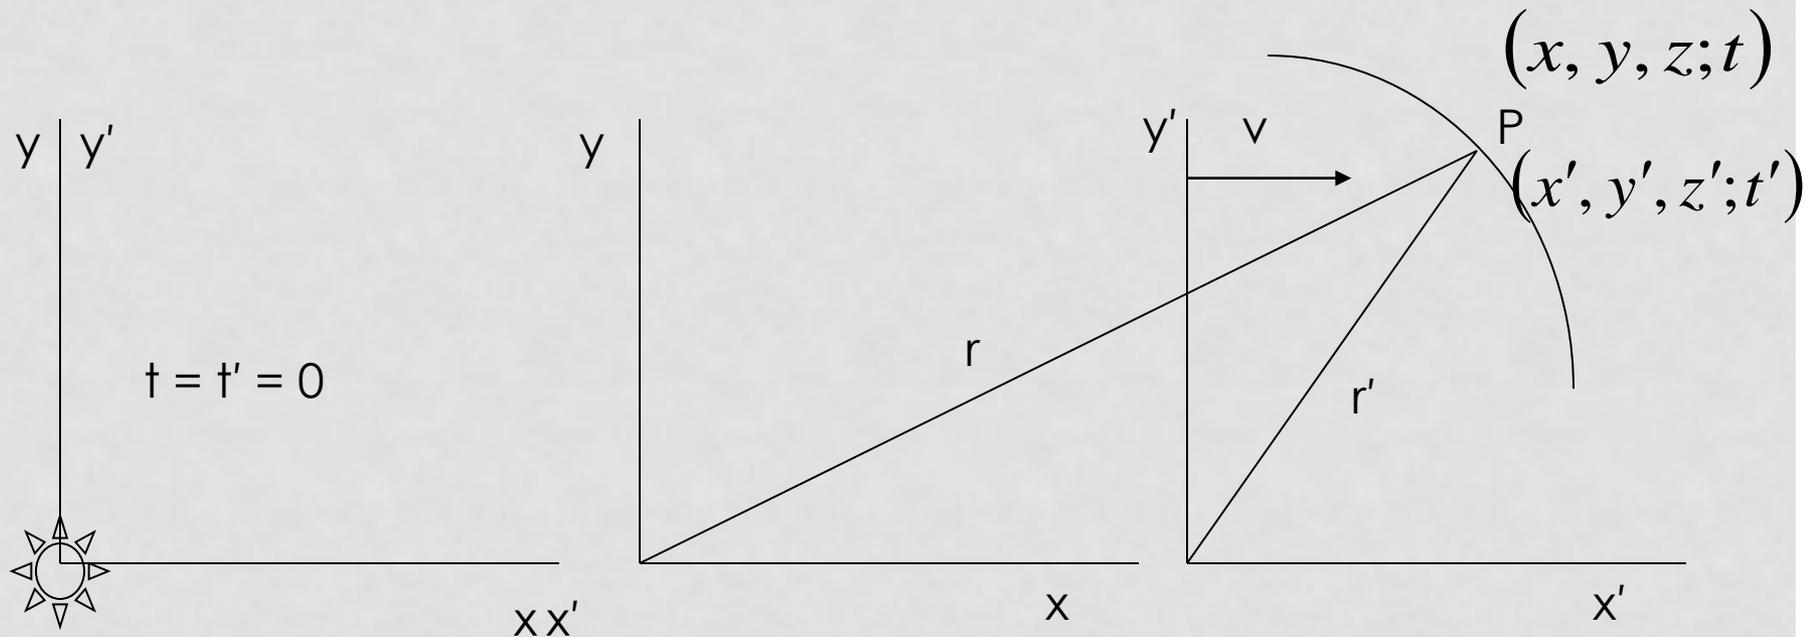

$$x' = (x - vt)\gamma$$

$$t' = \gamma \left(t - \frac{vx}{c^2} \right)$$

$$y' = y \quad z' = z$$

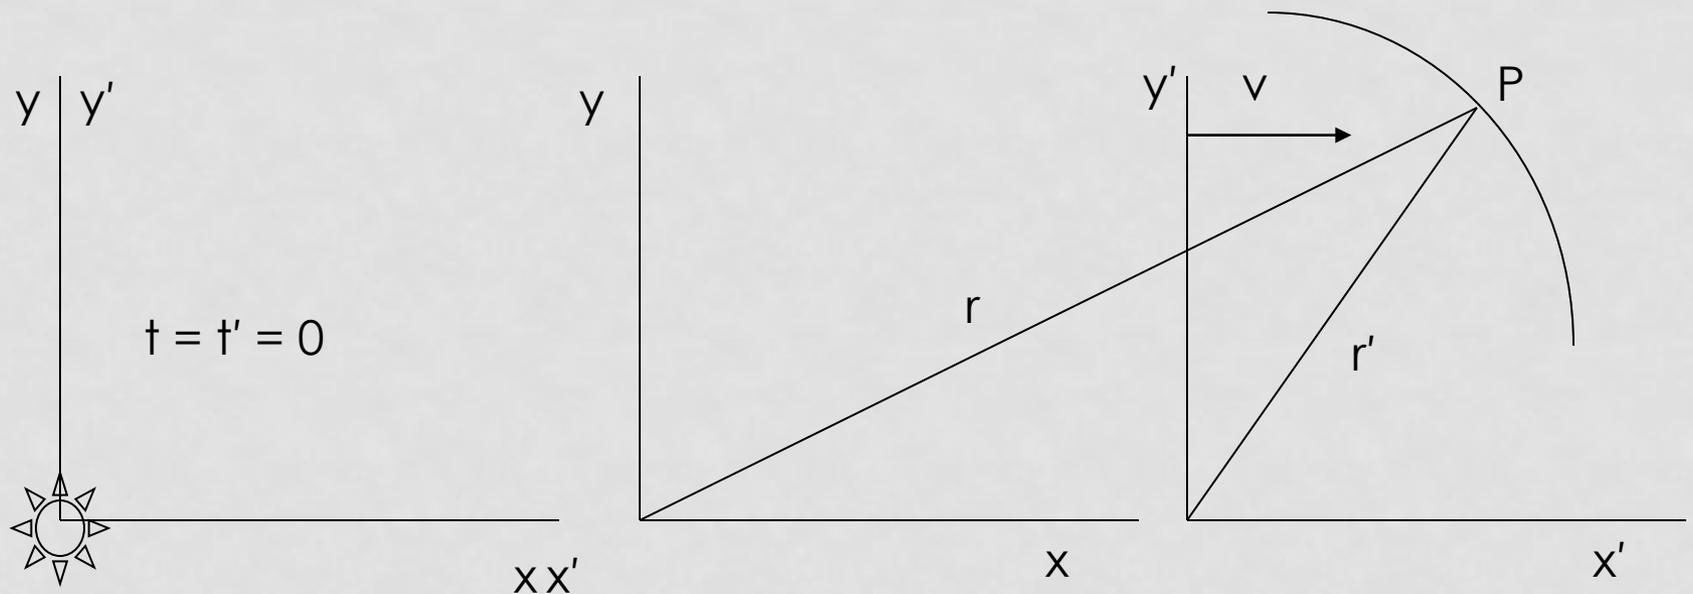

LORENTZ TRANSFORMATION

- The transformation equations are valid for all speeds $< c$.
- Consider a flash bulb attached to S' that goes off,

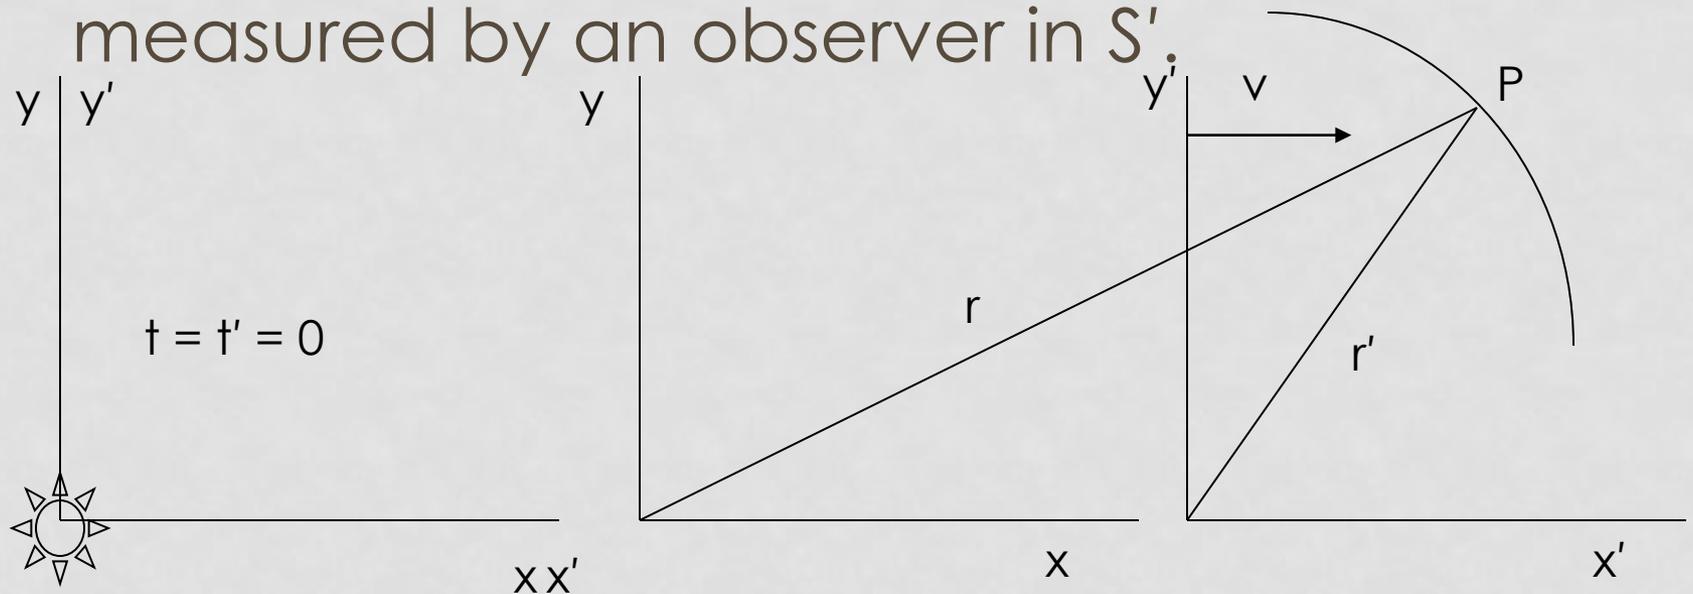

LORENTZ TRANSFORMATION

- At the instance it goes off the two frames coincide. At some later time the wavefront is at some point P.

LORENTZ TRANSFORMATION

- r : distance to a point on the wavefront measured by an observer in S .
- r' : distance to a point on the wavefront measured by an observer in S' .

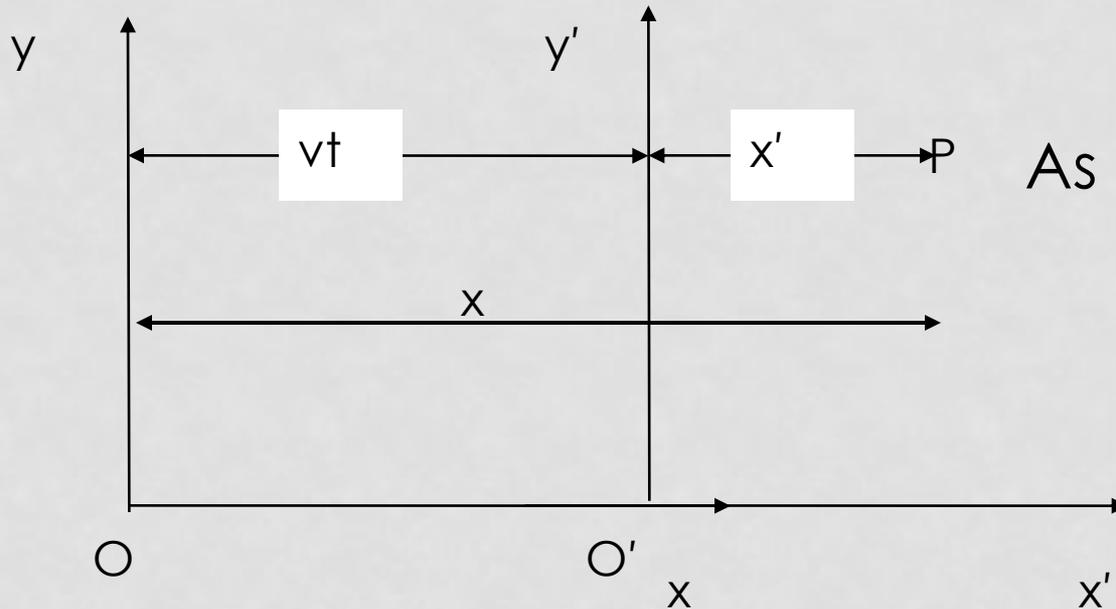

LORENTZ TRANSFORMATION

- $r=ct$..(1) Stationary Frame
- $r'=ct'$..(2) Moving Frame

LORENTZ TRANSFORMATION

- For simplicity, the general problem is stated so that the motion of P is along the x - x' axis.

As a result: $y=y'$; $z=z'$

LORENTZ TRANSFORMATION

- Radius of a sphere is $r^2 = x^2 + y^2 + z^2$ in the S frame and similarly $(r')^2 = (x')^2 + (y')^2 + (z')^2$ in the S' frame.

$$x^2 + y^2 + z^2 = c^2 t^2 \quad \dots(3)$$

$$(x')^2 + (y')^2 + (z')^2 = c^2 (t')^2 \quad \dots(4)$$

LORENTZ TRANSFORMATION

- Substituting $y = y'$; $z = z'$ into the previous equations and subtracting we get that,

$$x^2 - (x')^2 = c^2 t^2 - c^2 (t')^2$$

$$x^2 - c^2 t^2 = (x')^2 - c^2 (t')^2 \quad \dots(5)$$

LORENTZ TRANSFORMATION

- We know that in the stationary frame, the distance travelled is given by

$$x = vt \quad \text{..(6)}$$

- In the stationary frame, the distance travelled is

$$x' = 0 \quad \text{..(7)}$$

LORENTZ TRANSFORMATION

- We know that in the stationary frame, the distance travelled is given by

$$x = vt \quad \text{..(6)}$$

- In the stationary frame, the distance travelled is

- Using equations 5,6,7 we can show that,
 $x' = 0 \quad \text{..(7)}$

$$x' = (x - vt)\gamma \quad \text{..(8)} \quad t' = \left(t - \frac{v}{c^2} x \right) \gamma \quad \text{..(9)}$$

LORENTZ TRANSFORMATION

- Summary:

$$x' = (x - vt)\gamma$$

$$t' = \gamma \left(t - \frac{vx}{c^2} \right)$$

$$y' = y \quad z' = z$$

LORENTZ TRANSFORMATION

- Summary:

$$x' = (x - vt)\gamma$$

$$t' = \gamma \left(t - \frac{vx}{c^2} \right)$$

$$y' = y \quad z' = z$$

- The Lorentz transformations can be verified by substituting equations 8,9 into the RHS of equation 5.

LORENTZ TRANSFORMATION

- To produce the Lorentz transformations for primed frame to the unprimed frame we substitute v with $-v$.

$$x = (x' + vt')\gamma$$

$$t = \gamma \left(t' + \frac{vx'}{c^2} \right)$$

$$y = y' \quad z = z'$$

LORENTZ TRANSFORMATION

- For $v \ll c$, the Lorentz transformations reduce to the Galilean transformations. When $v \ll c$; $v/c \ll 1$ and $\frac{v^2}{c^2} \ll 1$

LORENTZ TRANSFORMATION

- Solution:
- The question requires us to transform from the unprimed to the primed! Therefore use,

$$x' = (x - vt)\gamma$$

$$t' = \gamma \left(t - \frac{vx}{c^2} \right)$$

$$y' = y \quad z' = z$$
